Executive Summary

In today's scenario will be checking code out from a branch from another U2 account that is not in our test account. Our programmer Bob has created 4 U2 programs that we would like in our test directory. Since we do not have access to Bob's account and he has put the source code into SVN version control we will use XLr8Editor to get these programs to our account. We will be using Eclipse IDE, SVN, and XLr8Editor.

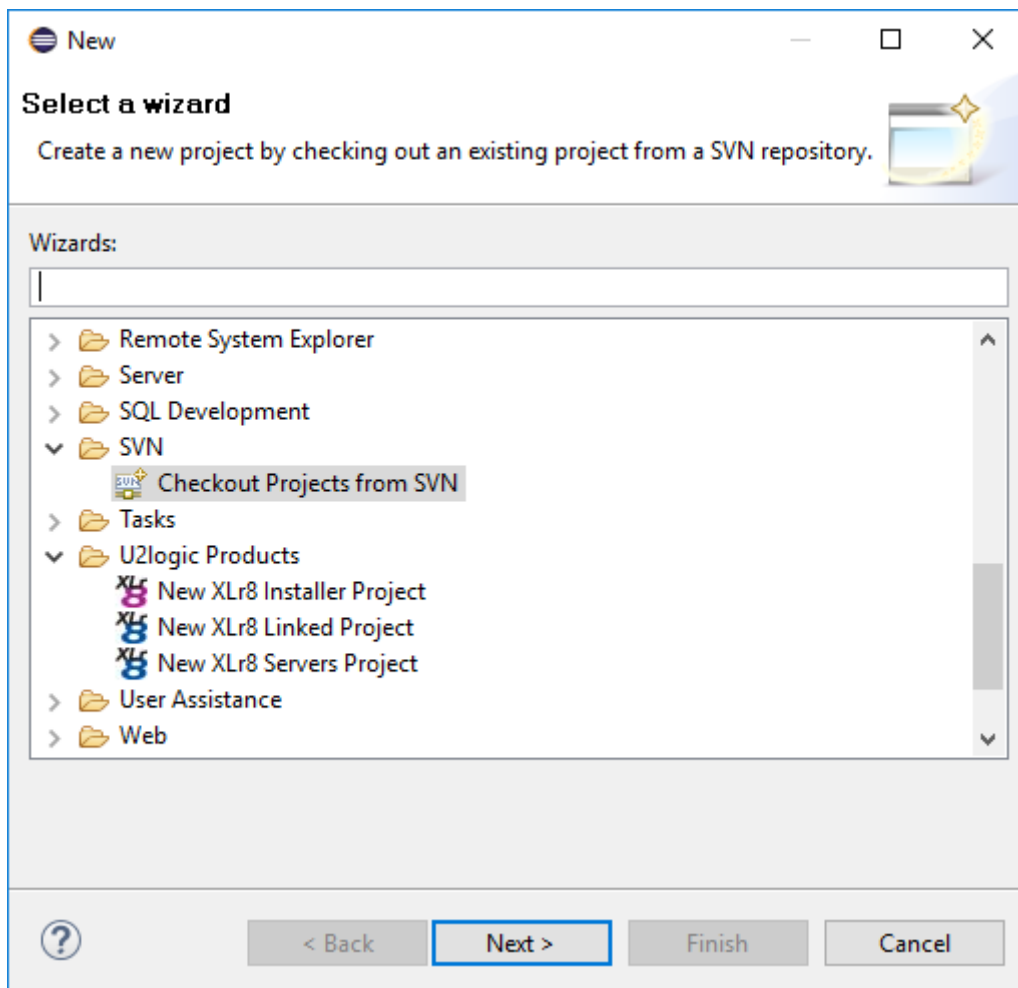

Right click on your server account to register a new multi-value account.

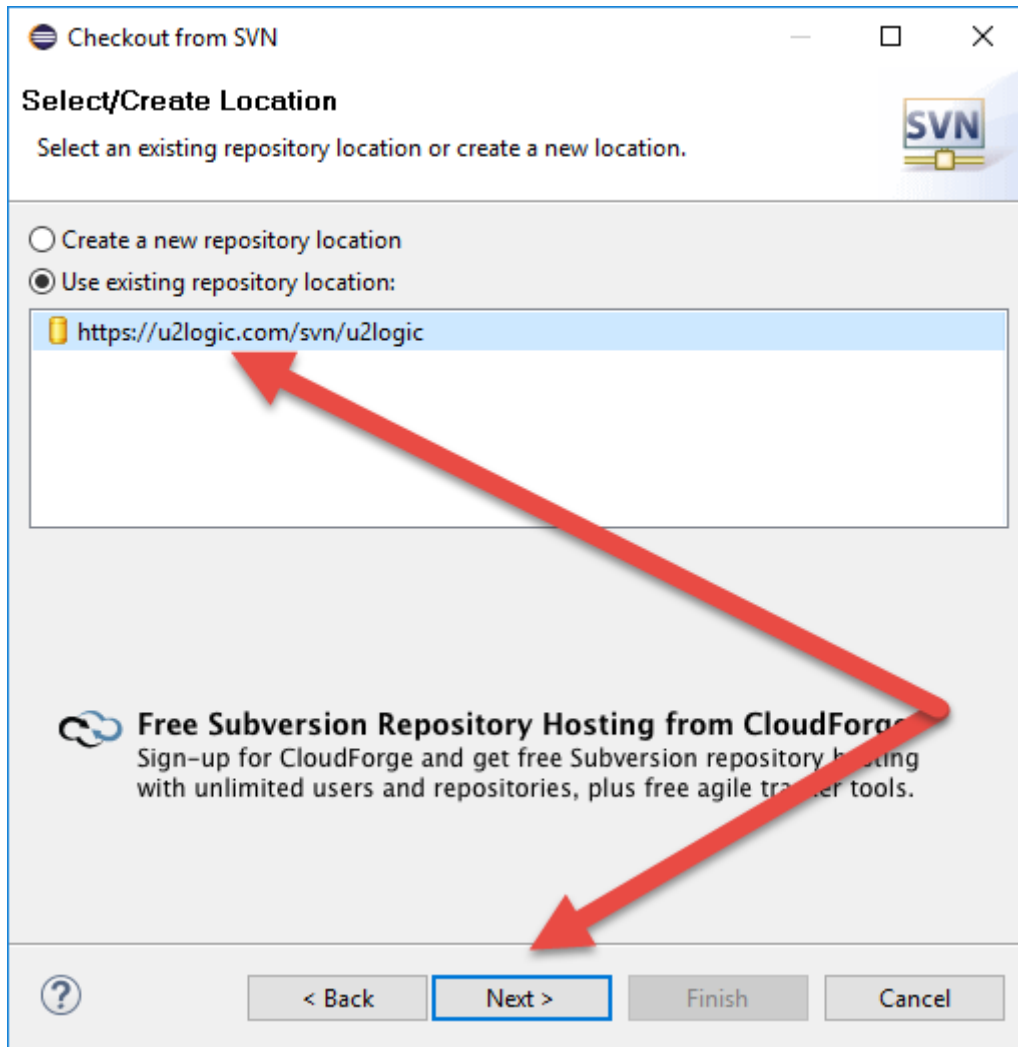

Use the Register New MV account wizard to set up a pointer to your U2 account. This requires the system to think you have a Bob account too.

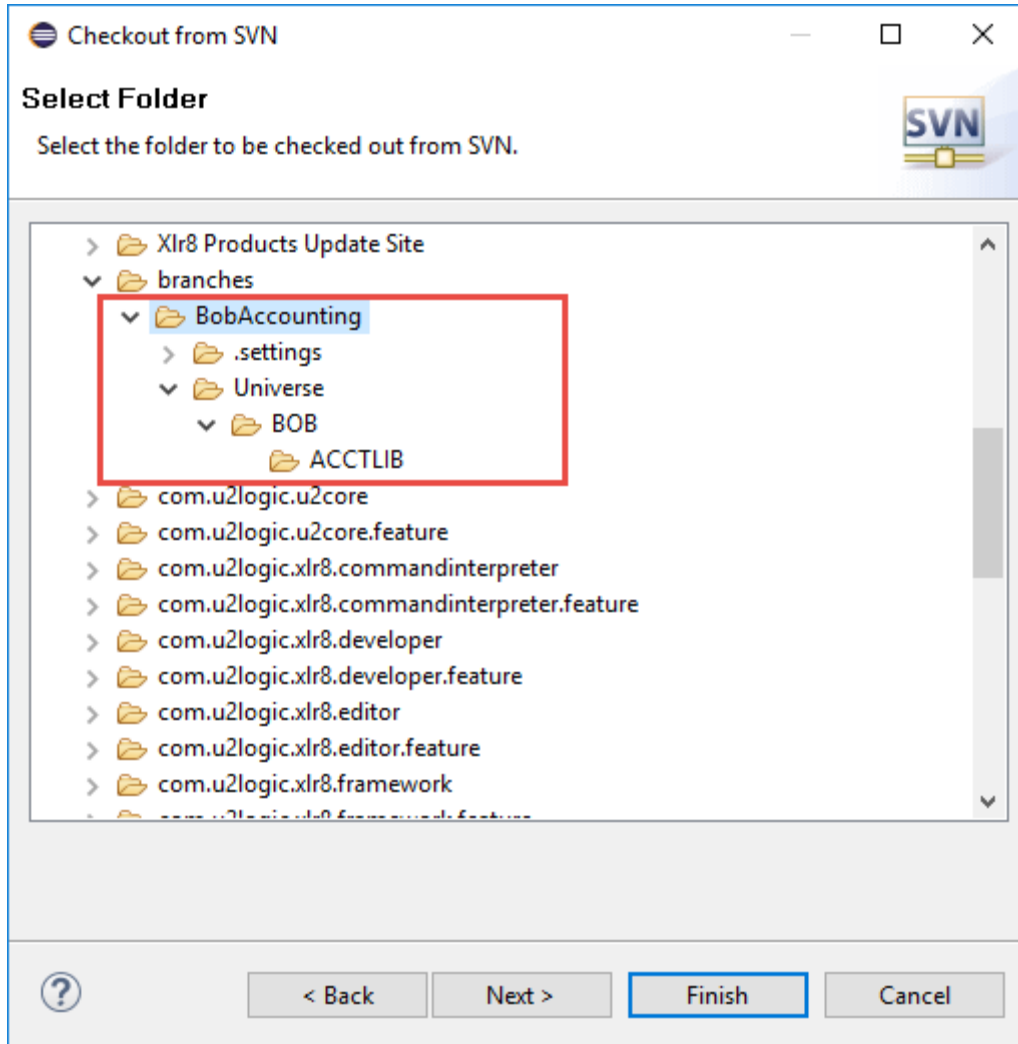

We are using the menu item File->New Other to get this wizard to check out Bob's project branch.

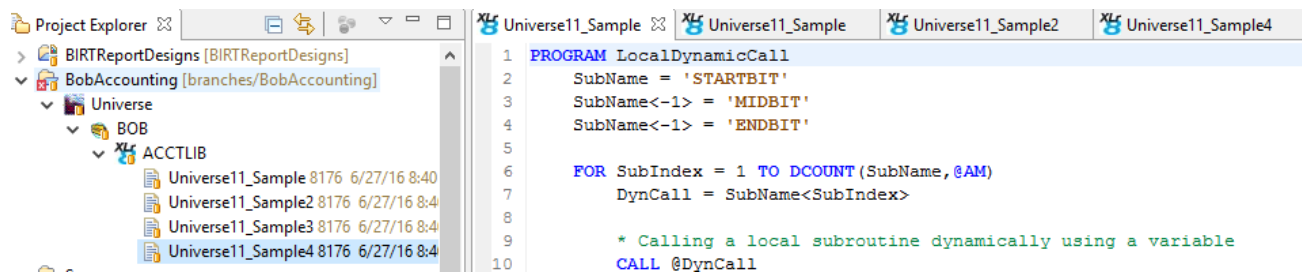

Pick your SVN directory and press the button Next.

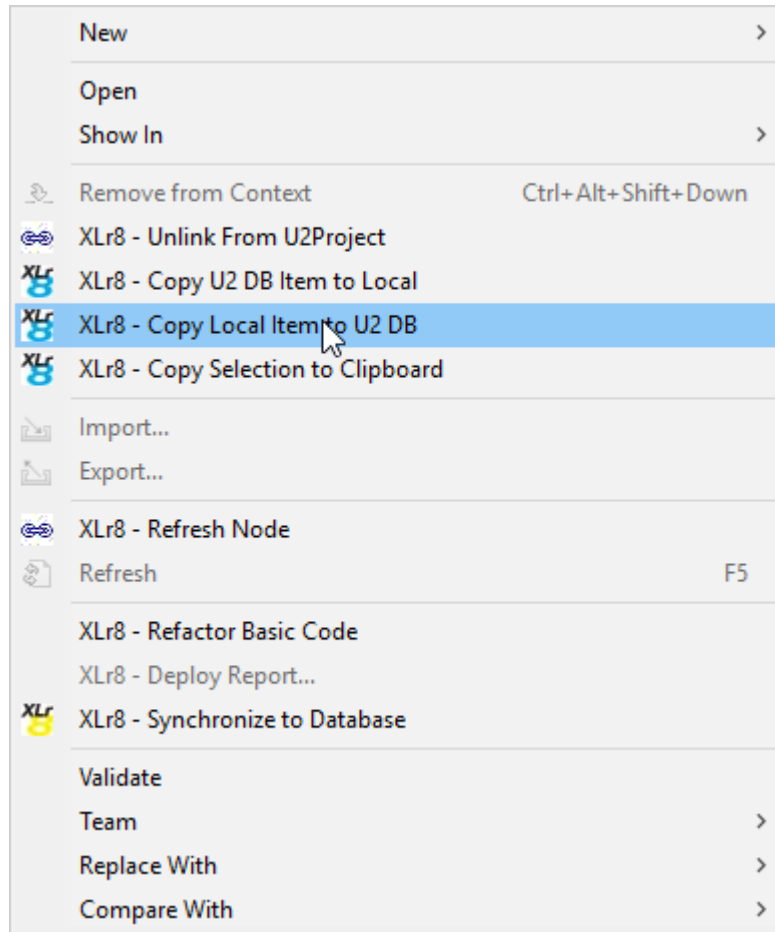

Pick the branch site called BobAccounting. You should notice that Bob's ACCTLIB directory is in another U2 account called BOB.

After you have added you branch to your Project Explorer, you should see this.

Right click on the version control project and copy the files form local item (BobAccounting) to U2 Database (Universe/ACCT.DATA/ACCTLIB).

Using Windows explorer, the files have been added to the correct file which was just a pointer that matched up to Bob's Accounting files.

This PC > c\$ (\\10.2.1.55) (Y:) > U2 > Accounts > ACCT.DATA > ACCTLIB
